This is the most important core component in the Petrel System and provides detailed geological information on the mapped terrain. This type of core has a resolution of 0.5m and is typically collected in areas that are generally less than 5m wide. The numbers in the centre of each rectangle in the layer indicate the number of cores used in that particular area. Petrel Geology & Geomorphology Core Visited: 1,542615. This layer contains both Petrel geology and geomorphology data. This type of core is collected in larger areas and provides much finer detail than the Geoscience core. This type of core has a resolution of 25m and is typically collected in areas that are more than 5m wide. The numbers in the centre of each rectangle in the layer indicate the number of cores used in that particular area. Petrel Soil Core Visited: 1,593926. The Soil core is the more advanced core and provides more accurate soil information. The core resolution is 10cm, however as the core is collected from down-drift points, the size of the core is typically much larger than 10cm. The Soil core is collected in areas that are usually larger than 5m wide. The numbers in the centre of each rectangle in the layer indicate the number of cores used in that particular area. Coloured Aerial Photo QGIS Layers: 1,575163. This layer contains the collection point data as well as the photos of the areas. In the centre of each of the blue rectangles is a count of the number of cores collected in that particular area. These blue rectangles cover all of the areas that were collected and do not represent the actual size of the soil cores. Rainfall History: 1,586430. The rainfall layers indicate the amount of rainfall for the periods of time between the cores collected. The most recent data is from the most recent core taken. Coloured Aerial Photo QGIS Layers: 1,603316. These layers are coloured aerial photos of the soil cores. These photos are used as the basis for identifying new soil mapping areas and for determining the size of the different soil cores. Soil Map layer: 1,602979. A Soil map layer showing the distribution of soil types, overlaid on the aerial photos. *{\Conflict data}* : (a) Red, = 2 red*[d 82157476af
